

Problem: Support for 3rd-Party Hypervisor-level Services

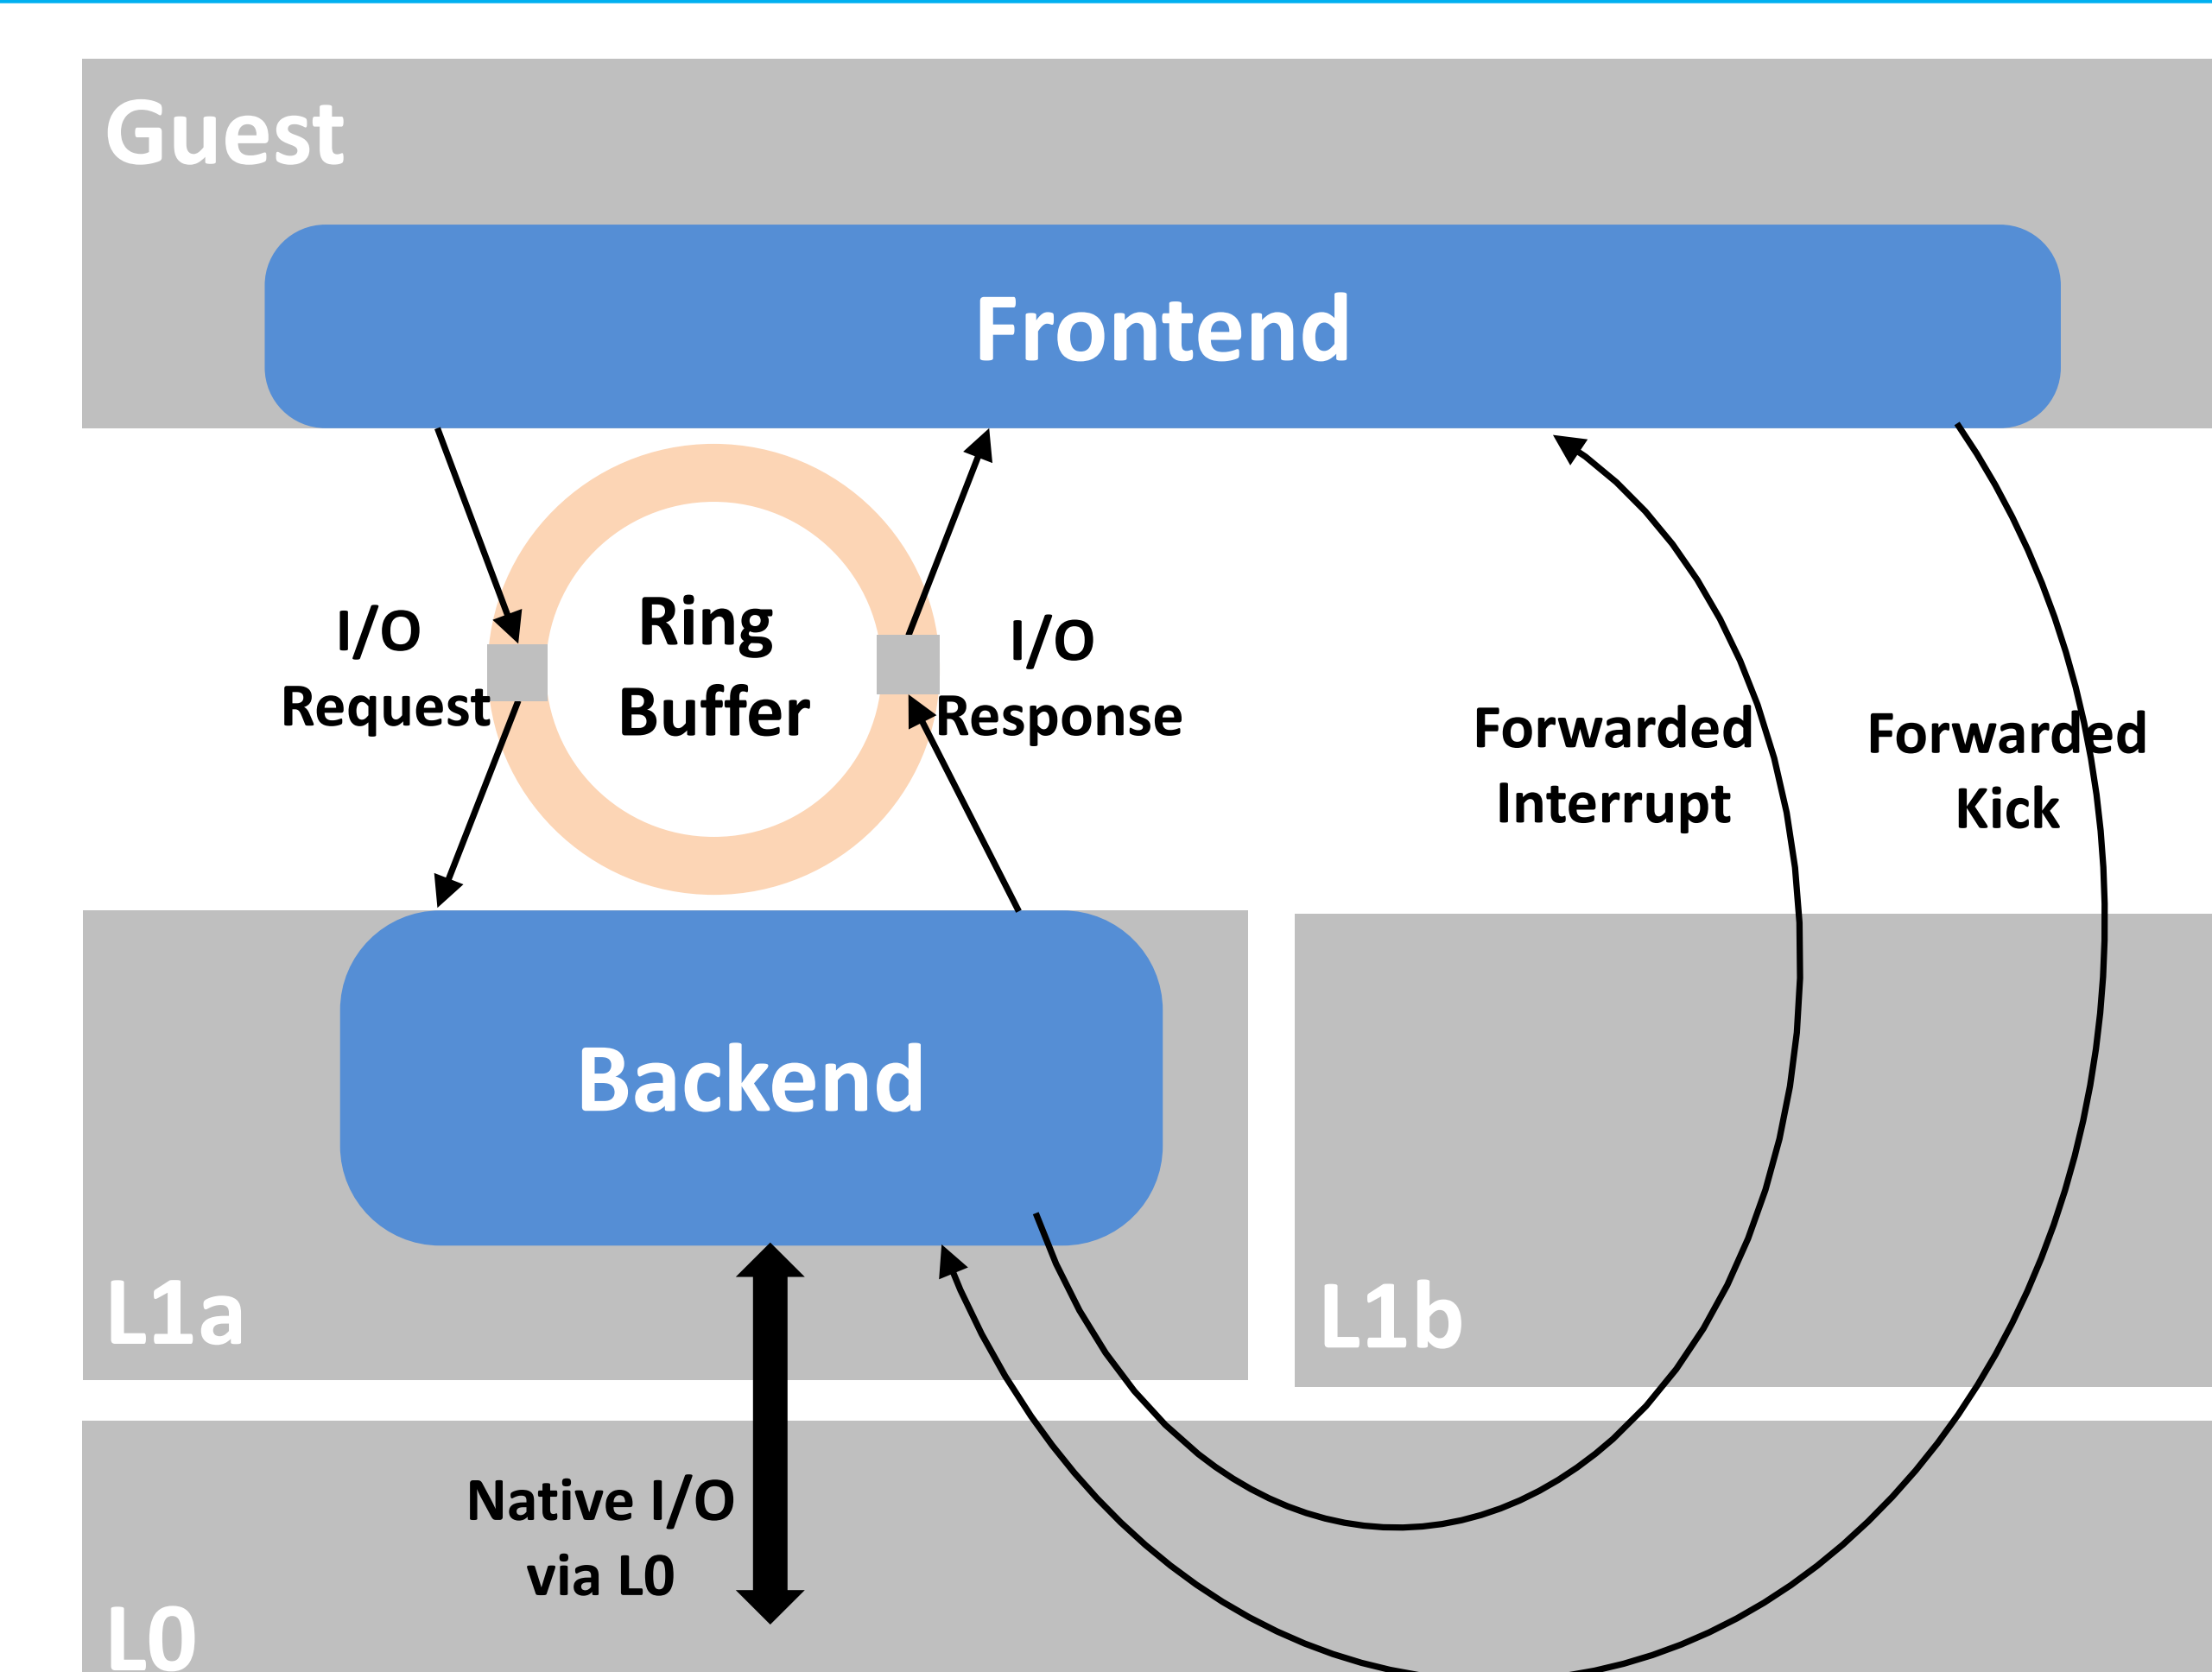

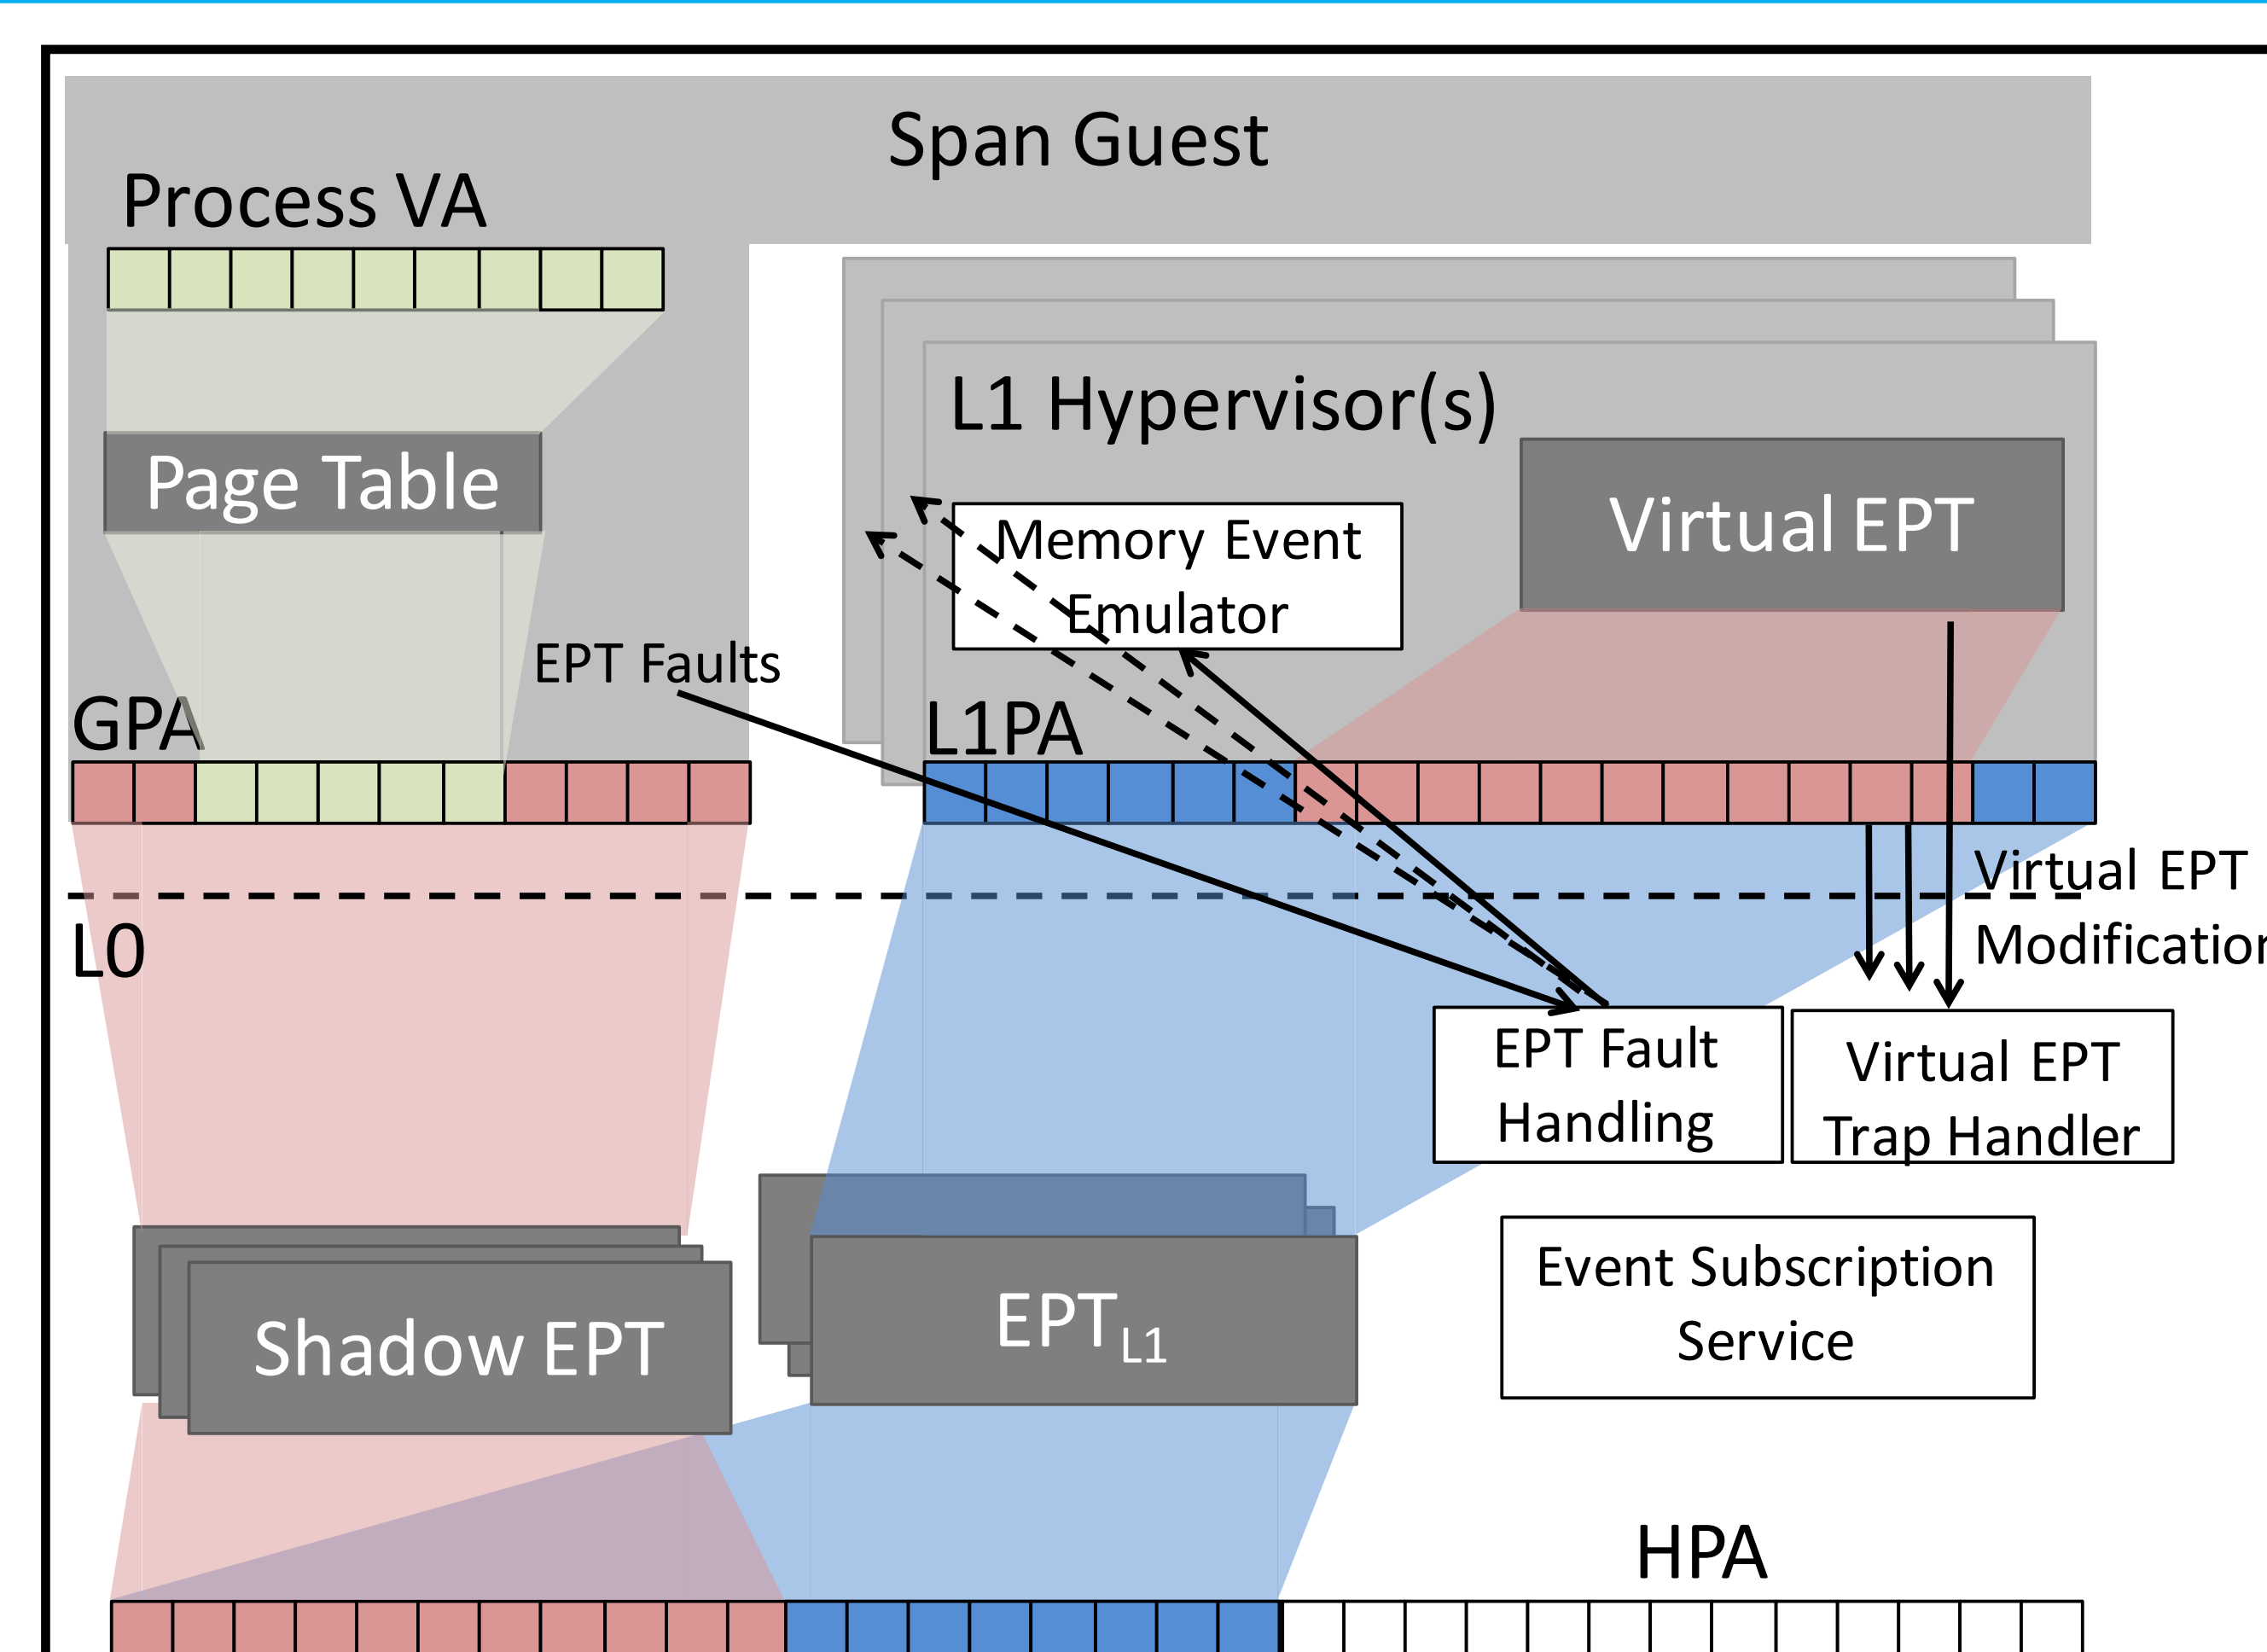

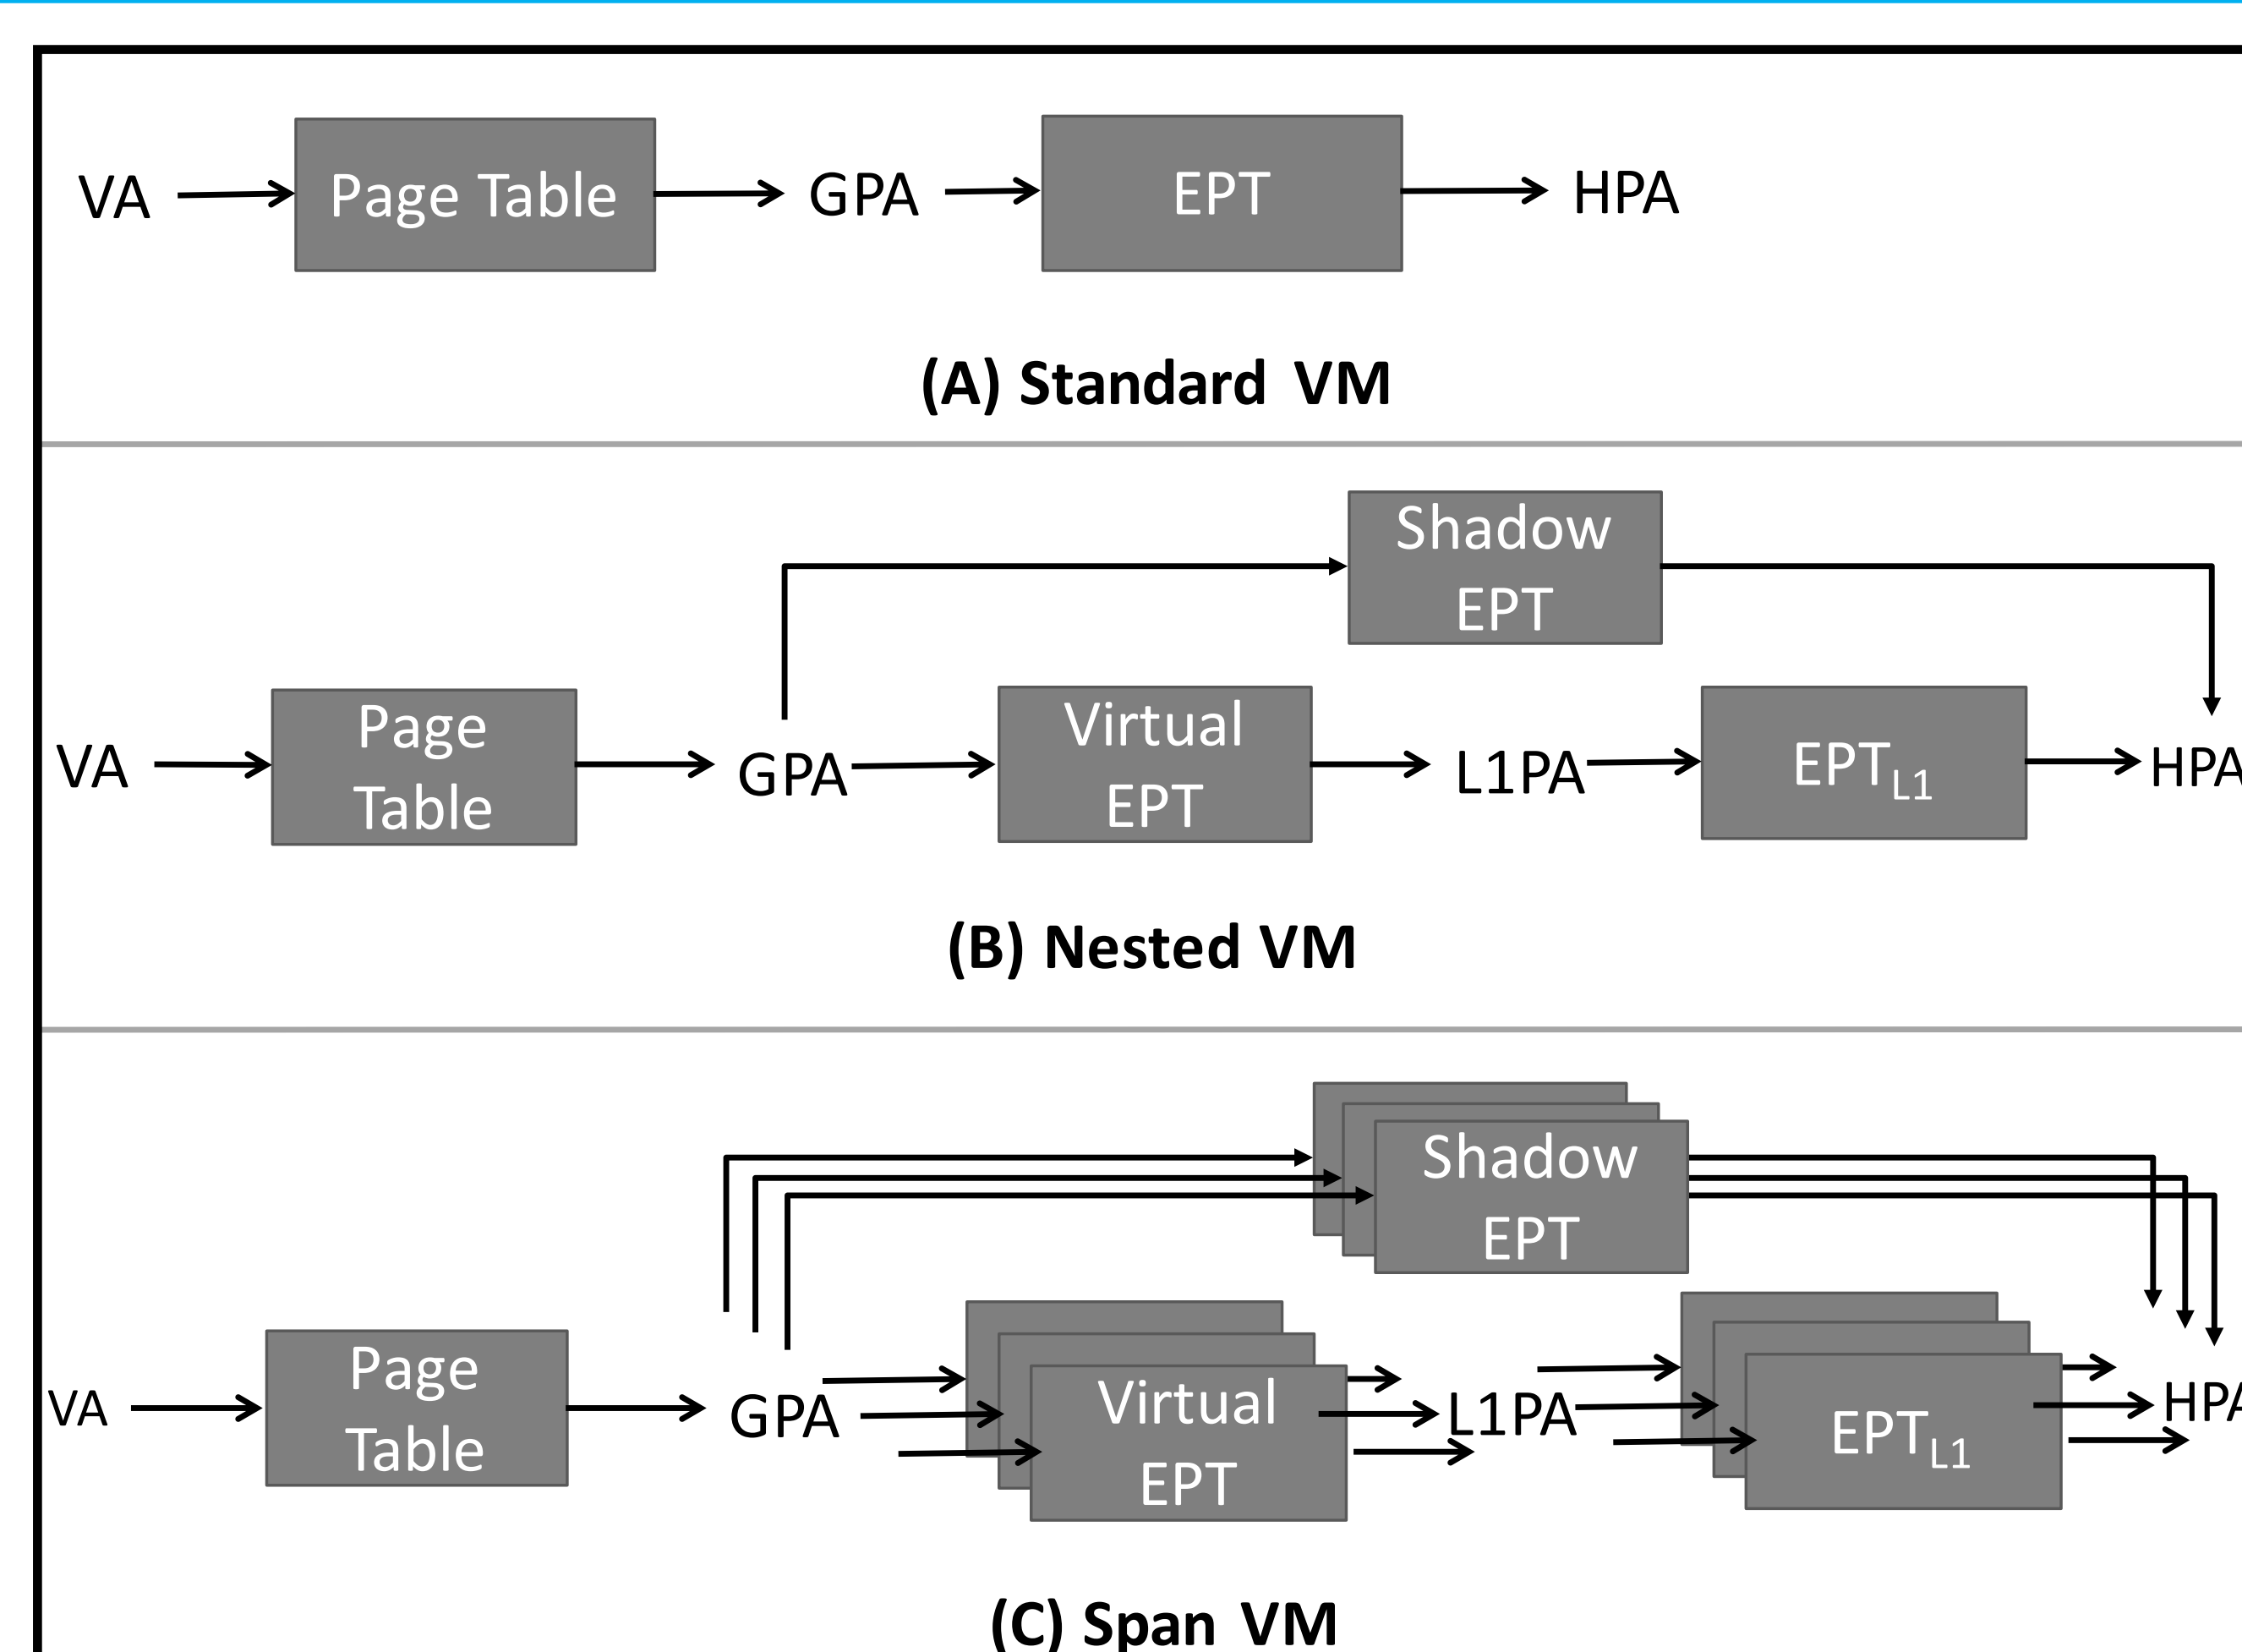

- Growing Number of Hypervisor-level Services:** VM Introspection, Intrusion Detection, High Availability, Live Migration, Live Patching, etc.
- Guests Cannot Simultaneously Use Multiple 3rd-party Services:** E.g. Cross-cloud migration, Customized guest security, Attestation, etc.

Solution: Compartmentalize Services & Share Guest Control

Featurevisors (F) : 3rd-party deprivileged “Hypervisors” providing guest services. **Hyperplexor** : Base L0 hypervisor.

Approach: Transparent and Simultaneous Control of Guest by Multiple L1 Hypervisors

- Guest Transparent:** No modifications to guest.
- Attach/Detach L1s to/from guest at runtime:** Partial/full control over guest memory, VCPUs, and I/O devices.
- Event Subscription:** L1s subscribe to guest events via L0.

Status, Results, and Future Work

- Key Publications:**
 - Multi-hypervisor Virtual Machines: Enabling an Eco-system of Hypervisor-level Services*, Accepted in **USENIX ATC, 2017**
 - Enabling Hypervisor-as-a-service Clouds with Ephemeral Virtualization*, **VEE 2016**.
- Prototype on KVM/QEMU Platform**
 - 0—15% overhead on benchmarks: Kernbench, iperf, quicksort.
 - Ephemeral virtualization: 80ms average switching times
 - Page fault servicing: 3.6—4.2us; Event Redirection: 13-41us.
- Ongoing/Future Work:**
 - Supporting unmodified L1 hypervisors.
 - Live hypervisor patching.
 - Support on public clouds.
